What Is Tramadol?

Tramadol is a centrally acting opioid analgesic prescribed to treat moderate to moderately severe pain. It works by binding to the brain's pain receptors and altering how the body perceives discomfort. Unlike many stronger opioids, Tramadol offers effective pain control with a lower risk of dependency when taken responsibly under medical supervision.

Tramadol is available in immediate-release and extended-release formulations, making it suitable for both short-term pain management and chronic conditions requiring ongoing relief.
